

# STRUCTURING: PYRAMID

There are two main ways to build a long-burn fire.

## Build a Pyramid

First step is to build a pyramid. The TINDER will be the inner-most layer of the pyramid. Pile the TINDER in a nice mound. This will be the base layer of structure for a long-burn campfire.

## Build a Pyramid

The KINDLING you collected will be the second layer of the campfire. Stack KINDLING around the pile of TINDER you made by bracing these bigger sticks or small branches on each other in a pyramid shape.

## Build a Pyramid

Last step of the pyramid is add FUEL logs around the pyramid like a wooden tent. Once this structure is established, you can continue to add fuel logs to keep burning as long as you need.

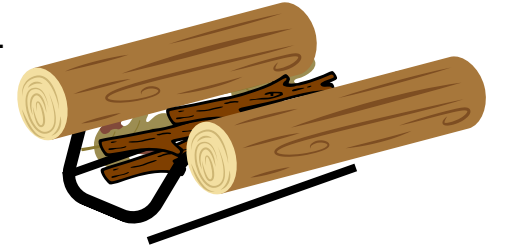

# STRUCTURING: PALETTE

There are two main ways to build a long-burn fire.

## Build a Palette

A palette build is similar to the pyramid build with the main difference being that the FUEL logs are stacked on top of each other.

## Build a Palette

The first step for a palette build is to get two large and long pieces of FUEL logs. You will place these on either side of a small trench. Inside the trench is where you will lay your TINDER and some KINDLING.

## Build a Palette

The next step is to layer shorter FUEL logs facing the opposite direction of the two you placed around the trench. You should put KINDLING sticks in-between gaps to catch the next layer on fire sooner.

## Build a Palette

This pattern can continue to alternate and add new layers as you need them for longer and hotter burns.
